

Substitution cost is routing-dependent per axis, but the anti-HER2 – endocrine contrast is robust (CPTAC external, hypothesis-only)

Bars = mean cost (mis-route % in parens). Panel B = bootstrap 95% CI; excludes 0 → contrast robust to routing scheme.

Honest reading: endocrine · chemo per-axis cost FLIPS between routings (0.378↔0.035, 0.105↔0.510) → NOT a safety claim. Robust = anti-HER2 mis-route 1.00 under both + the contrast above.
